

# High Performance, Low Power HDMI™/DVI Transmitter

Preliminary Technical Data

AD9387NK

## FEATURES

### General

- Low power HDMI/DVI transmitter ideal for portable applications
- Compatible with HDMI v. 1.3, DVI v. 1.0, and HDCP v. 1.2
- Single 1.8 V power supply
- Video/audio inputs accept logic levels from 1.8 V to 3.3 V
- 64-lead LFCSP, Pb-free package
- 76-ball CSP\_BGA, Pb-free package

### Digital video

- 80 MHz operation supports all resolutions from 480i to 1080i and XGA at 75 Hz
- Programmable 2-way color space converter
- Supports RGB, YCbCr, and DDR
- Supports ITU656-based embedded syncs
- Automatic input video format timing detection (CEA-861D)

### Digital audio

- Supports standard S/PDIF for stereo LPCM or compressed audio up to 192 kHz
- 8-channel, uncompressed LPCM I<sup>2</sup>S audio up to 192 kHz

### Special features for easy system design

- On-chip MPU with I<sup>2</sup>C® master to perform HDCP operations and EDID reading operations
- 5 V tolerant I<sup>2</sup>C and HPD I/Os, no extra device needed
- No audio master clock needed for supporting S/PDIF and I<sup>2</sup>S
- On-chip MPU reports HDMI events through interrupts and registers

## APPLICATIONS

- Digital video cameras
- Digital still cameras
- Personal media players
- Cellular handsets
- DVD players and recorders
- Digital set-top boxes
- A/V receivers
- HDMI repeater/splitter

## GENERAL DESCRIPTION

The AD9387NK is an 80 MHz, high definition multimedia interface (HDMI) v.1.3 transmitter. It supports HDTV formats up to 720p and 1080i and computer graphic resolutions up to XGA (1024 × 768 @ 75Hz). With the inclusion of HDCP, the AD9387NK allows the secure transmission of protected content, as specified by the HDCP v.1.1 protocol.

### Rev. PrA

## FUNCTIONAL BLOCK DIAGRAM

Figure 1.

The AD9387NK supports both S/PDIF and 8-channel I<sup>2</sup>S audio. Its high fidelity, 8-channel I<sup>2</sup>S can transmit either stereo or 7.1 surround audio at 192 kHz. The S/PDIF can carry stereo LPCM audio or compressed audio, including Dolby® Digital, DTS®, and THX®.

The AD9387NK helps reduce system design complexity and cost by incorporating such features as an internal MPU for HDCP operations, an I<sup>2</sup>C master for EDID reading, a single 1.8 V power supply, and 5 V tolerance on the I<sup>2</sup>C and hot plug detect pins.

Fabricated in an advanced CMOS process, the AD9387NK is available in a space saving, 76-ball CSP\_BGA or 64-lead LFCSP surface-mount package. Both packages are available as Pb-free parts and are specified from -25°C to +85°C.

<sup>1</sup> See the Explanation of Test Levels section.<sup>2</sup> Using low output drive strength.<sup>3</sup> UI = unit interval.

## ABSOLUTE MAXIMUM RATINGS

Table 2.

| Parameter                    | Rating          |
|------------------------------|-----------------|
| Digital Inputs               | 5 V to 0.0 V    |
| Digital Output Current       | 20 mA           |
| Operating Temperature Range  | –40°C to +85°C  |
| Storage Temperature Range    | –65°C to +150°C |
| Maximum Junction Temperature | 150°C           |
| Maximum Case Temperature     | 150°C           |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## EXPLANATION OF TEST LEVELS

- I. 100% production tested.
- II. 100% production tested at 25°C and sample tested at specified temperatures.
- III. Sample tested only.
- IV. Parameter is guaranteed by design and characterization testing.
- V. Parameter is a typical value only.
- VI. 100% production tested at 25°C; guaranteed by design and characterization testing.
- VII. Limits defined by HDMI specification; guaranteed by design and characterization testing.

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Table 3. Pin Function Descriptions

| Pin No.                                |                       | Mnemonic              | Type <sup>1</sup> | Description                                                                                                                                                                                                                                 |
|----------------------------------------|-----------------------|-----------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BGA                                    | LFCSP                 |                       |                   |                                                                                                                                                                                                                                             |
| A1 to A10, B1 to B10, C9, C10, D9, D10 | 39 to 47, 50 to 63, 2 | D[23:0]               | I                 | Video Data Input. Digital input in RGB or YCbCr format. Supports CMOS logic levels from 1.8 V to 3.3 V.                                                                                                                                     |
| D1                                     | 6                     | CLK                   | I                 | Video Clock Input. Supports CMOS logic levels from 1.8 V to 3.3 V.                                                                                                                                                                          |
| C2                                     | 3                     | DE                    | I                 | Data Enable Bit for Digital Video. Supports CMOS logic levels from 1.8 V to 3.3 V.                                                                                                                                                          |
| C1                                     | 4                     | HSYNC                 | I                 | Horizontal Sync Input. Supports CMOS logic levels from 1.8 V to 3.3 V.                                                                                                                                                                      |
| D2                                     | 5                     | VSYNC                 | I                 | Vertical Sync Input. Supports CMOS logic levels from 1.8 V to 3.3 V.                                                                                                                                                                        |
| J3                                     | 18                    | EXT_SWG               | I                 | Sets internal reference currents. Place 887 $\Omega$ resistor (1% tolerance) between this pin and ground.                                                                                                                                   |
| K3                                     | 20                    | HPD                   | I                 | Hot Plug Detect Signal. This indicates to the interface if the receiver is connected. Supports CMOS logic levels from 1.8 V to 5.0 V.                                                                                                       |
| E2                                     | 7                     | S/PDIF                | I                 | S/PDIF (Sony/Philips Digital Interface) Audio Input. This is the audio input from a Sony/Philips digital interface. Supports CMOS logic levels from 1.8 V to 3.3 V.                                                                         |
| E1                                     | 8                     | MCLK                  | I                 | Audio Reference Clock. $128 \times N \times f_s$ with $N = 1, 2, 3,$ or $4$ . Set to $128 \times$ sampling frequency ( $f_s$ ), $256 \times f_s$ , $384 \times f_s$ , or $512 \times f_s$ . Supports CMOS logic levels from 1.8 V to 3.3 V. |
| F2, F1, G2, G1                         | 9 to 12               | I <sup>2</sup> S[3:0] | I                 | I <sup>2</sup> S Audio Data Inputs. These represent the eight channels of audio (two per input) available through I <sup>2</sup> S. Supports CMOS logic levels from 1.8 V to 3.3 V.                                                         |
| H2                                     | 13                    | SCLK                  | I                 | I <sup>2</sup> S Audio Clock. Supports CMOS logic levels from 1.8 V to 3.3 V.                                                                                                                                                               |
| H1                                     | 14                    | LRCLK                 | I                 | Left/Right Channel Selection. Supports CMOS logic levels from 1.8 V to 3.3 V.                                                                                                                                                               |
| J7                                     | 26                    | PD/A0                 | I                 | Power-Down Control and I <sup>2</sup> C Address Selection. The I <sup>2</sup> C address and the PD polarity are set by the PD/A0 pin state when the supplies are applied to the AD9387NK. Supports CMOS logic levels from 1.8 V to 3.3 V.   |
| K1, K2                                 | 21, 22                | TxC-/TxC+             | O                 | Differential Clock Output. Differential clock output at pixel clock rate; TMDS logic level.                                                                                                                                                 |
| K10, J10                               | 30, 31                | Tx2-/Tx2+             | O                 | Differential Output Channel 2. Differential output of the red data at 10 $\times$ the pixel clock rate; TMDS logic level.                                                                                                                   |

| Pin No.                                          |                                 | Mnemonic  | Type <sup>1</sup> | Description                                                                                                                                                                                                         |
|--------------------------------------------------|---------------------------------|-----------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BGA                                              | LFCSP                           |           |                   |                                                                                                                                                                                                                     |
| K7, K8                                           | 27, 28                          | Tx1–/Tx1+ | O                 | Differential Output Channel 1. Differential output of the green data at 10× the pixel clock rate; TMDS logic level.                                                                                                 |
| K4, K5                                           | 24, 25                          | Tx0–/Tx0+ | O                 | Differential Output Channel 0. Differential output of the blue data at 10× the pixel clock rate; TMDS logic level.                                                                                                  |
| H10                                              | 32                              | INT       | O                 | Interrupt. Open drain. A 2 kΩ pull-up resistor to the microcontroller I/O supply is recommended.                                                                                                                    |
| J2, J5, J8, K9                                   | 19, 23, 29                      | AVDD      | P                 | 1.8 V Power Supply for TMDS Outputs.                                                                                                                                                                                |
| D5, D6, D7, E7                                   | 1, 48, 49                       | DVDD      | P                 | 1.8 V Power Supply for Digital and I/O Power Supply. These pins supply power to the digital logic and I/Os. They should be filtered and as quiet as possible.                                                       |
| G4, G5, J1                                       | 15, 16, 17                      | PVDD      | P                 | 1.8 V PLL Power Supply. The most sensitive portion of the AD9387NK is the clock generation circuitry. These pins provide power to the clock PLL. The designer should provide quiet, noise-free power to these pins. |
| D4, E4, F4, J4,<br>G6, J6, K6, F7,<br>G7, H9, J9 | 64, Paddle<br>on bottom<br>side | GND       | P                 | Ground. The ground return for all circuitry on-chip. It is recommended that the AD9387NK be assembled on a single, solid ground plane with careful attention given to ground current paths.                         |
| F9                                               | 36                              | SDA       | C <sup>2</sup>    | Serial Port Data I/O. This pin serves as the serial port data I/O slave for register access. Supports CMOS logic levels from 1.8V to 3.3V.                                                                          |
| F10                                              | 35                              | SCL       | C <sup>2</sup>    | Serial Port Data Clock. This pin serves as the serial port data clock slave for register access. Supports CMOS logic levels from 1.8V to 3.3V.                                                                      |
| E10                                              | 37                              | MDA       | C <sup>2</sup>    | Serial Port Data I/O Master to HDCP Key EEPROM. Supports CMOS logic levels from 1.8 V to 3.3 V.                                                                                                                     |
| E9                                               | 38                              | MCL       | C <sup>2</sup>    | Serial Port Data Clock Master to HDCP Key EEPROM. Supports CMOS logic levels from 1.8 V to 3.3 V.                                                                                                                   |
| G9                                               | 34                              | DDCSDA    | C <sup>2</sup>    | Serial Port Data I/O to Receiver. This pin serves as the master to the DDC bus. Supports 5 V CMOS logic level.                                                                                                      |
| G10                                              | 33                              | DDCSCL    | C <sup>2</sup>    | Serial Port Data Clock to Receiver. This pin serves as the master clock for the DDC bus. Supports 5 V CMOS logic level.                                                                                             |

<sup>1</sup> I = input, O = output, P = power supply, C = control.

<sup>2</sup> For a full description of the 2-wire serial interface and its functionality, obtain documentation by contacting NDA from [flatpanel\\_apps@analog.com](mailto:flatpanel_apps@analog.com).

## APPLICATIONS INFORMATION

### DESIGN RESOURCES

Analog Devices, Inc. evaluation kits, reference design schematics, and other support documentation are available under NDA from [flatpanel\\_apps@analog.com](mailto:flatpanel_apps@analog.com).

Other resources include the following:

- *EIA/CEA-861D*, a technical specifications document that describes audio and video infoframes, as well as the E-EDID structure for HDMI. It is available from the Consumer Electronics Association (CEA).
- *HDMI v. 1.3*, a defining document for HDMI 1.3, and *HDMI Compliance Test Specification v. 1.3*. They are available from HDMI Licensing, LLC.
- *HDCP Specification v1.1*, the defining technical specifications document for the HDCP v. 1.1. It is available from Digital Content Protection, LLC.

### DOCUMENT CONVENTIONS

In this data sheet, data is represented using the conventions described in Table 4.

**Table 4. Document Conventions**

| Data Type | Format                                                                                                                   |
|-----------|--------------------------------------------------------------------------------------------------------------------------|
| 0xNN      | Hexadecimal (Base 16) numbers are represented using the C language notation, preceded by 0x.                             |
| 0bNN      | Binary (Base 2) numbers are represented using the C language notation, preceded by 0b.                                   |
| NN        | Decimal (Base 10) numbers are represented using no additional prefixes or suffixes.                                      |
| Bit       | Bits are numbered in little endian format; that is, the least significant bit of a byte or word is referred to as Bit 0. |

## PCB LAYOUT RECOMMENDATIONS

The AD9387NK is a high precision, high speed analog device. For maximum performance, it is important that board layout be optimized.

### POWER SUPPLY BYPASSING

It is recommended that each power supply pin be bypassed with a 0.1  $\mu$ F capacitor. The exception is when two or more supply pins are adjacent to each other. For these groupings of powers and grounds, it is necessary to have only one bypass capacitor. The fundamental idea is to have a bypass capacitor within about 0.5 cm of each power pin. Avoid placing the capacitor on the opposite side of the PC board from the AD9387NK, as doing so interposes resistive vias in the path.

The bypass capacitors should be located between the power plane and the power pin. Current should flow from the power plane to the capacitor to the power pin. Do not make a power connection between the capacitor and the power pin. Placing a via underneath the capacitor pads, down to the power plane, is generally the best approach.

It is particularly important to maintain low noise and good stability of PVDD (the PLL supply). Abrupt changes in PVDD can result in similarly abrupt changes in sampling clock phase and frequency. Such changes can be avoided by careful attention to regulation, filtering, and bypassing. It is best practice to provide separate regulated supplies for each of the analog circuitry groups (AVDD and PVDD).

It is also recommended that a single ground plane be used for the entire board. Experience has repeatedly shown that the noise performance is the same or better with a single ground plane. Using multiple ground planes can be detrimental because each separate ground plane is smaller, and long ground loops can result.

### DIGITAL INPUTS

#### *Video and Audio Data Input Signals*

The digital inputs on the AD9387NK are designed to work with signals ranging from 1.8 V to 3.3 V logic level. Therefore, no extra components need to be added when using 3.3 V logic. Any noise that gets onto the clock input (labeled CLK) trace adds jitter to the system. Therefore, minimize the video clock input (Pin 6, CLK) trace length, and do not run any digital or other high frequency traces near it. Make sure to match the length of the input data signals to optimize data capture, especially for high frequency modes, such as 720p or XGA at 75 Hz and double data rate input formats.

#### *Other Input Signals*

The HPD must be connected to the HDMI connector. A 10 k $\Omega$  pull-down resistor to ground is also recommended.

The PD/A0 input pin can be connected to GND or supply (through a resistor or a control signal). The device address and power-down polarity are set by the state of the PD/A0 pin when the AD9387NK supplies are applied/enabled. For example, if the PD/A0 pin is low (when the supplies are turned on), then the device address is 0x72 and the power-down is active high. If the PD/A0 pin is high (when the supplies are turned on), the device address is 0x7A and the power down is active low.

The SCL and SDA pins should be connected to the I<sup>2</sup>C master. A pull-up resistor of 2 k $\Omega$  to 1.8 V or 3.3 V is recommended.

### EXTERNAL SWING RESISTOR

The external swing resistor must be connected directly to the EXT\_SWG pin and ground. The external swing resistor must have a value of 887  $\Omega$  ( $\pm 1\%$  tolerance). Avoid running any high speed ac or noisy signals next to, or close to, the EXT\_SWG pin.

### OUTPUT SIGNALS

#### *TMDS Output Signals*

The AD9387NK has three TMDS data channels (0, 1, and 2) that output signals up to 800 MHz, as well as the TMDS output data clock. To minimize the channel-to-channel skew, make the trace length of these signals the same. Also, these traces need a 50  $\Omega$  characteristic impedance and should be routed as 100  $\Omega$  differential pairs. Best practice recommends routing these lines on the top PCB layer, avoiding the use of vias.

#### *Other Output Signals (non TMDS)*

#### **DDCSCL and DDCSDA**

The DDCSCL and DDCSDA outputs need a minimum amount of capacitance loading to ensure the best signal integrity. The DDCSCL and DDCSDA capacitance loading must be less than 50 pF to meet the HDMI compliance specification. The DDCSCL and DDCSDA must be connected to the HDMI connector, and a pull-up resistor to 5 V is required. The pull-up resistor must have a value between 1.5 k $\Omega$  and 2 k $\Omega$ .

#### **INT Pin**

The INT pin is an output that should be connected to the system microcontroller. A pull-up resistor to 1.8 V or 3.3 V is required for proper operation; the recommended value is 2 k $\Omega$ .

#### **MCL and MDA**

The MCL and MDA outputs should be connected to the EEPROM containing the HDCP key (if HDCP is implemented). Pull-up resistors of 2 k $\Omega$  are recommended.

## OUTLINE DIMENSIONS
