

# $2.5 \ \Omega$ CMOS Low Power Dual 2:1 Mux/Demux USB 1.1 Switch

# ADG787

#### **FEATURES**

USB 1.1 signal switching compliant -3 dB bandwidth, 150 MHz Tiny 10-lead LFCSP and MSOP packages, 10-ball WLCSP package Single-supply 1.8 V to 5.5 V operation Low on resistance 2.5 Ω typical 3.45 Ω maximum at 85°C Typical power consumption: <0.1 μW

#### **APPLICATIONS**

USB 1.1 signal switching circuits Cellular phones PDAs MP3 players Battery-powered systems Headphone switching Audio and video signal routing Communications systems

#### **GENERAL DESCRIPTION**

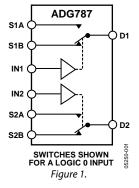

The ADG787 is a low voltage, CMOS device that contains two independently selectable single-pole, double-throw (SPDT) switches. It is designed as a general analog-to-digital switch and can also be used for routing USB 1.1 signals.

This device offers low on resistance of typically 2.5  $\Omega$ , making the part an attractive solution for applications that require low distortion through the switch.

The ADG787 comes in a 10-ball WLCSP, a tiny 10-lead LFCSP, and a tiny 10-lead MSOP. These packages make the ADG787 the ideal solution for space-constrained applications.

Each switch conducts equally well in both directions when on and has an input signal range that extends to the supplies. The ADG787 exhibits break-before-make switching action.

| Time at Peak Temperature                    | 10 sec to 40 sec  |  |  |  |  |  |

<sup>1</sup> Overvoltages at the IN, S, or D pins are clamped by internal diodes. Current should be limited to the maximum ratings given.

#### **ESD CAUTION**

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

### **PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS**

### TERMINOLOGY

I<sub>DD</sub> Positive supply current.

V<sub>D</sub> (V<sub>S</sub>) Analog voltage on Terminal D and Terminal S.

 $R_{\rm ON}$  Ohmic resistance between D and S.

 $\mathbf{R}_{\text{FLAT (ON)}}$ Flatness is defined as the difference between the maximum and minimum value of on resistance as measured.

 $\Delta R_{\text{ON}}$  On resistance match between any two channels.

Is (OFF) Source leakage current with the switch off.

 $I_D$  (OFF) Drain leakage current with the switch off.

 $I_{\rm D},\,I_{\rm S}\left(ON\right)$  Channel leakage current with the switch on.

 $\mathbf{V}_{\text{INL}}$  Maximum input voltage for Logic 0.

V<sub>INH</sub> Minimum input voltage for Logic 1.

I<sub>INL</sub> (I<sub>INH</sub>) Input current of the digital input.

 $C_s$  (OFF) Off switch source capacitance. Measured with reference to ground.

 $C_D$  (OFF) Off switch drain capacitance. Measured with reference to ground.

 $C_D$ ,  $C_S$  (ON) On switch capacitance. Measured with reference to ground.

C<sub>IN</sub> Digital input capacitance.

#### ton

Delay time between the 50% and the 90% points of the digital input and switch on condition.

toff

Delay time between the 50% and the 90% points of the digital input and switch off condition.

**t**<sub>BBM</sub> On or off time measured between the 80% points of both switches when switching from one to another.

**Charge Injection** A measure of the glitch impulse transferred from the digital input to the analog output during on-off switching.

**Off Isolation** A measure of unwanted signal coupling through an off switch.

**Crosstalk** A measure of unwanted signal that is coupled from one channel to another as a result of parasitic capacitance.

**-3 dB Bandwidth** The frequency at which the output is attenuated by 3 dB.

**On Response** The frequency response of the on switch.

**Insertion Loss** The loss due to the on resistance of the switch.

**THD + N** The ratio of the harmonic amplitudes plus noise of a signal, to the fundamental.

 $T_{\text{SKEW}}$ The measure of the variation in propagation delay between each channel.

#### **Rise Time Delay**

The rise time of a signal is a measure of the time for the signal to rise from 10% of the ON level to 90% of the ON level. Rise time delay is the difference between the rise time, measured at the input, and the rise time, measured at the output.

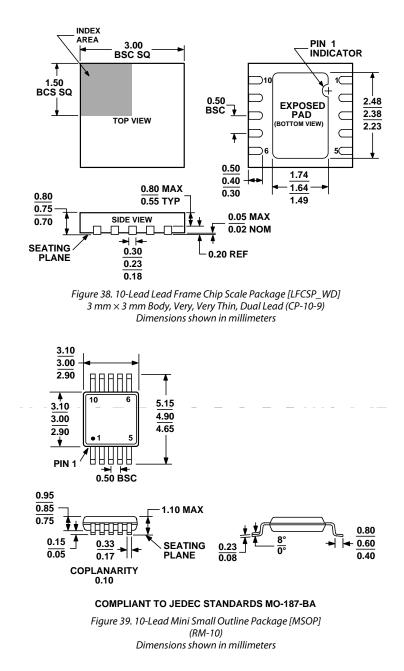

#### Fall Time Delay

The fall time of a signal is a measure of the time for the signal to fall from 90% of the ON level to 10% of the ON level. Fall time delay is the difference between the fall time, measured at the input, and the fall time, measured at the output.

#### **Rise-Time-to-Fall-Time Mismatch**

This is the absolute value between the variation in the fall time and the rise time, measured at the output.

### **OUTLINE DIMENSIONS**
