

# High Speed, Isolated RS-485 Transceiver with Integrated Transformer Driver

**ADM2485** 

### **FEATURES**

Half-duplex, isolated RS-485 transceiver Integrated oscillator driver for external transformer PROFIBUS® compliant Complies with ANSI/TIA/EIA RS-485-A-98 and

ISO 8482:1987(E)
Data rate: 16 Mbps
5 V or 3.3 V operation (VDD1)
50 nodes on bus

High common-mode transient immunity: >25 kV/µs

Isolated DE OUT status output Thermal shutdown protection Safety and regulatory approvals

UL recognition: 2500 V rms for 1 minute per UL 1577

**VDE Certificate of Conformity** 

DIN V VDE V 0884-10 (VDE V 0884-10):2006-12

Reinforced insulation,  $V_{IORM} = 560 \text{ V}$  peak Operating temperature range:  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ 

Wide-body, 16-lead SOIC package

#### **APPLICATIONS**

Isolated RS-485/RS-422 interfaces
PROFIBUS networks
Industrial field networks
Multipoint data transmission systems

#### **GENERAL DESCRIPTION**

The ADM2485 differential bus transceiver is an integrated, galvanically isolated component designed for bidirectional data communication on multipoint bus transmission lines. It is designed for balanced transmission lines and complies with ANSI/TIA/EIA RS-485-A-98 and ISO 8482:1987(E).

The device employs Analog Devices, Inc., *i*Coupler\* technology to combine a 3-channel isolator, a three-state differential line driver, and a differential input receiver into a single package. An on-chip oscillator outputs a pair of square waveforms that drive an external transformer to provide isolated power with an external transformer. The logic side of the device can be powered with either a 5 V or a 3.3 V supply, and the bus side is powered with an isolated 5 V supply.

#### **FUNCTIONAL BLOCK DIAGRAM**

The ADM2485 driver has an active high enable. The driver differential outputs and the receiver differential inputs are connected internally to form a differential input/output port that imposes minimal loading on the bus when the driver is disabled or when  $V_{\rm DD1}$  or  $V_{\rm DD2}$  = 0 V. Also provided is an active high receiver disable that causes the receive output to enter a high impedance state.

The device has current-limiting and thermal shutdown features to protect against output short circuits and situations where bus contention might cause excessive power dissipation. The part is fully specified over the industrial temperature range and is available in a 16-lead, wide-body SOIC package.

| COMMON-MODE TRANSIENT IMMUNITY <sup>1</sup> | 25  |      |      | kV/μs | Transient magnitude = 800 V, V <sub>CM</sub> = 1 kV   |
| HIGH FREQUENCY COMMON-MODE NOISE IMMUNITY   |     | 100  |      | mV    | $V_{HF} = +5 \text{ V}, -2 \text{ V} < V_{TEST2} < +7 \text{ V},$<br>1 MHz < $f_{TEST} < 50 \text{ MHz}, \text{ see Figure 24}$ |

<sup>&</sup>lt;sup>1</sup> CM is the maximum common-mode voltage slew rate that can be sustained while maintaining specification-compliant operation. V<sub>CM</sub> is the common-mode potential difference between the logic and bus sides. The transient magnitude is the range over which the common mode is slewed. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges.

### **TIMING SPECIFICATIONS**

 $2.7~V \leq V_{DD1} \leq 5.5~V,\,4.75~V \leq V_{DD2} \leq 5.25~V,\,T_A = T_{MIN}~to~T_{MAX},\,unless~otherwise~noted.$

### **REGULATORY INFORMATION**

**Table 4. ADM2485 Approvals** 

| Organization | Approval Type   | Notes   |
|--------------|---|---|
| UL           | Recognized under the Component Recognition Program of Underwriters Laboratories, Inc. | In accordance with UL 1577, each ADM2485 is proof tested by applying an insulation test voltage ≥3000 V rms for 1 second (current leakage detection limit = 5 µA).                |
| VDE          | Certified according to DIN V VDE V 0884-10 (VDE V 0884-10): 2006-12                   | In accordance with DIN V VDE V 0884-10, each ADM2485 is proof tested by applying an insulation test voltage ≥1050 V peak for 1 second (partial discharge detection limit = 5 pC). |

### **INSULATION AND SAFETY-RELATED SPECIFICATIONS**

Table 5.

| Parameter  | Symbol | Value     | Unit  | Conditions   |
|--|--------|-----------|-------|--|
| Rated Dielectric Insulation Voltage              |        | 2500      | V rms | 1-minute duration  |
| Minimum External Air Gap (External Clearance)    | L(I01) | 5.15 min  | mm    | Measured from input terminals to output terminals, shortest distance through air |
| Minimum External Tracking (Creepage)             | L(I02) | 5.5 min   | mm    | Measured from input terminals to output terminals, shortest distance along body  |
| Minimum Internal Gap (Internal Clearance)        |        | 0.017 min | mm    | Insulation distance through insulation   |
| Tracking Resistance (Comparative Tracking Index) | CTI    | >175      | V     | DIN IEC 112/VDE 0303-1   |
| Isolation Group                                  |        | Illa      |       | Material Group (DIN VDE 0110: 1989-01, Table 1)                                  |

<sup>&</sup>lt;sup>2</sup> Input capacitance is from any input data pin to ground.

### **VDE 0884-2 INSULATION CHARACTERISTICS**

This isolator is suitable for basic electrical isolation only within the safety limit data. Maintenance of the safety data must be ensured by means of protective circuits.

An asterisk (\*) on packages denotes DIN V VDE V 0884-10 approval.

| Infrared (15 sec)                    | 220°C                                       |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

#### **ESD CAUTION**

**ESD** (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

### PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 6. Pin Configuration

**Table 8. Pin Function Description** 

| Pin No.       | Mnemonic         | Function   |
|---------------|------------------|--|
| 1             | D1               | Transformer Driver Terminal 1.   |
| 2             | D2               | Transformer Driver Terminal 2.   |
| 3             | GND₁             | Ground, Logic Side.  |
| 4             | $V_{DD1}$        | Power Supply, Logic Side (3.3 V or 5 V). Decoupling capacitor to GND $_1$ required; capacitor value should be between 0.01 $\mu$ F and 0.1 $\mu$ F.  |
| 5             | RxD              | Receiver Output Data. This output is high when $(A - B) > 200 \text{ mV}$ and low when $(A - B) < -200 \text{ mV}$ . The output is tristated when the receiver is disabled, that is, when $\overline{\text{RE}}$ is driven high. |
| 6             | RE               | Receiver Enable Input. This is an active-low input. Driving this input low enables the receiver; driving it high disables the receiver.  |
| 7             | RTS              | Driver Enable Input. Driving this input high enables the driver; driving it low disables the driver.   |
| 8             | TxD              | Driver Input. Data to be transmitted by the driver is applied to this input.   |
| 9, 11, 14, 15 | GND <sub>2</sub> | _Ground, Bus Side  |
| 10            | DE OUT           | Driver Enable Status Output.   |
| 12            | A                | Noninverting Driver Output/Receiver Input. When the driver is disabled or V <sub>DD1</sub> or V <sub>DD2</sub> is powered down, Pin A is put in a high impedance state to avoid overloading the bus.                             |
| 13            | В                | Inverting Driver Output/Receiver Input. When the driver is disabled or V <sub>DD1</sub> or V <sub>DD2</sub> is powered down, Pin B is put in a high impedance state to avoid overloading the bus.                                |
| 16            | $V_{DD2}$        | Power Supply, Bus Side (Isolated 5 V Supply). Decoupling capacitor to GND <sub>2</sub> required; capacitor value should be between 0.01 $\mu$ F and 0.1 $\mu$ F.   |

# CIRCUIT DESCRIPTION ELECTRICAL ISOLATION

In the ADM2485, electrical isolation is implemented on the logic side of the interface. Therefore, the part has two main sections: a digital isolation section and a transceiver section (see Figure 30). Driver input and data enable, applied to the TxD and RTS pins, respectively, and referenced to logic ground  $(GND_1)$ , are coupled across an isolation barrier to appear at the transceiver section referenced to isolated ground  $(GND_2)$ . Similarly, the receiver output, referenced to isolated ground in the transceiver section, is coupled across the isolation barrier to appear at the RxD pin referenced to logic ground.

### iCoupler Technology

The digital signals are transmitted across the isolation barrier using *i*Coupler technology. This technique uses chip-scale transformer windings to couple the digital signals magnetically from one side of the barrier to the other. Digital inputs are encoded into waveforms that are capable of exciting the primary transformer winding. At the secondary winding, the induced waveforms are then decoded into the binary value that was originally transmitted.

Figure 30. ADM2485 Digital Isolation and Transceiver Sections

#### **TRUTH TABLES**

Table 10 and Table 11 use the abbreviations found in Table 9.

**Table 9. Truth Table Abbreviations** 

| Letter | Description          |
|--------|----------------------|
| Н      | High level           |
| 1      | Indeterminate        |
| L      | Low level            |
| Χ      | Irrelevant           |
| Z      | High impedance (off) |
| NC     | Disconnected         |

Table 10. Transmitting

| Supply           | / Status         | Inputs |     | Outputs |   | tputs  |
|------------------|------------------|--------|-----|---------|---|--------|

| Off              | Off       | X                         | L or NC | L   |

#### THERMAL SHUTDOWN

The ADM2485 contains thermal shutdown circuitry that protects the part from excessive power dissipation during fault conditions. Shorting the driver outputs to a low impedance source can result in high driver currents. The thermal sensing circuitry detects the increase in die temperature under this condition and disables the driver outputs. This circuitry is designed to disable the driver outputs when a die temperature of 150°C is reached. As the device cools, the drivers are re-enabled at a temperature of 140°C.

#### **RECEIVER FAIL-SAFE INPUTS**

The receiver input includes a fail-safe feature that guarantees a Logic high RxD output when the A and B inputs are floating or open-circuited.

#### **MAGNETIC FIELD IMMUNITY**

Because *i*Couplers use a coreless technology, no magnetic components are present and the problem of magnetic saturation of the core material does not exist. Therefore, *i*Couplers have essentially infinite dc field immunity. The following analysis defines the conditions under which this can occur. The ADM2485 3.3 V operating condition is examined because it represents the most susceptible mode of operation.

The limitation on the *i*Coupler ac magnetic field immunity is set by the condition in which the induced error voltage in the receiving coil (the bottom coil, in this case) is made sufficiently large, either to falsely set or reset the decoder. The voltage induced across the bottom coil is given by

$$V = \left(\frac{-d\beta}{dt}\right) \sum \pi r_n^2 \; ; \; n = 1, 2 \dots N$$
 (1)

where, if the pulses at the transformer output are greater than 1.0 V in amplitude:

 $\beta$  is the magnetic flux density (gauss).

N is the number of turns in the receiving coil.

 $r_n$  is the radius of nth turn in the receiving coil (cm).

The decoder has a sensing threshold of about 0.5 V; therefore, there is a 0.5 V margin where induced voltages can be tolerated.

Given the geometry of the receiving coil and an imposed requirement that the induced voltage is, at most, 50% of the 0.5 V margin at the decoder, a maximum allowable magnetic field is calculated, as shown in Figure 31.

Figure 31. Maximum Allowable External Magnetic Flux Density vs. Magnetic Field Frequency

For example, at a magnetic field frequency of 1 MHz, the maximum allowable magnetic field of 0.2 kGauss induces a voltage of 0.25 V at the receiving coil, which is about 50% of the sensing threshold and does not cause a faulty output transition. Similarly, if such an event occurs during a transmitted pulse and it is the worst-case polarity, it reduces the received pulse from  $>1.0~{\rm V}$  to 0.75 V, still well above the 0.5 V sensing threshold of the decoder.

Figure 32 shows the magnetic flux density values in terms of more familiar quantities, such as maximum allowable current flow at given distances from the ADM2485 transformers.

Figure 32. Maximum Allowable Current for Various Current-to-ADM2485 Spacings

At combinations of strong magnetic field and high frequency, any loops formed by printed circuit board (PCB) traces could induce sufficiently large error voltages to trigger the thresholds of succeeding circuitry. Care must be taken in the layout of such traces to avoid this possibility.

# APPLICATIONS INFORMATION PCB LAYOUT

The ADM2485 isolated RS-485 transceiver requires no external interface circuitry for the logic interfaces. Power supply bypassing is required at the input and output supply pins (see Figure 33).

Bypass capacitors are most conveniently connected between Pin 3 and Pin 4 for  $V_{\rm DD1}$  and between Pin 15 and Pin 16 for  $V_{\rm DD2}.$  The capacitor value must be between 0.01  $\mu F$  and 0.1  $\mu F$ . The total lead length between both ends of the capacitor and the input power supply pin must not exceed 20 mm.

Bypassing between Pin 9 and Pin 16 is also recommended unless the ground wires on the  $V_{\rm DD2}$  side are connected close to the package.

Figure 33. Recommended Printed Circuit Board Layout

In applications involving high common-mode transients, care must be taken to ensure that board coupling across the isolation barrier is minimized. Furthermore, the board layout must be designed such that any coupling that does occur equally affects all pins on a given component side.

Failure to ensure this can cause voltage differentials between pins exceeding the device absolute maximum ratings, thereby leading to latch-up or permanent damage.

#### TRANSFORMER SUPPLIERS

The transformer primarily used with the ADM2485 must be a center-tapped transformer winding. The turns ratio of the transformer must be set to provide the minimum required output voltage at the maximum anticipated load with the minimum input voltage. Table 12 shows ADM2485 transformer suppliers.

**Table 12. Transformer Suppliers** 

| Manufacturer     | Primary Voltage 3.3 V | Primary Voltage 5 V |
|------------------|-----------------------|---------------------|
| Coilcraft        | DA2304-AL             | DA2303-AL           |
| C&D Technologies | 782485/35C            | 782485/55C          |

#### APPLICATIONS DIAGRAM

The ADM2485 integrates a transformer driver that, when used with an external transformer and LDO, generates an isolated 5 V power supply, to be supplied between V<sub>DD2</sub> and GND<sub>2</sub>.

D1 and D2 of the ADM2485 drive the center-tapped Transformer T1. A pair of Schottky diodes and a smoothing capacitor is used to create a rectified signal from the secondary winding. The ADP3330 linear voltage regulator provides a regulated 5 V power supply to the ADM2485 bus-side circuitry ( $V_{\rm DD2}$ ), as shown in Figure 34.

When the ADM2485 is powered by 3.3 V on the logic side, a 1CT:2.2CT Transformer T1 is required to step up the 3.3 V to 6 V, ensuring enough headroom for the ADP3330 LDO to output a regulated 5 V output.

If ADM2485 is powered by 5 V on the logic side, a 1CT:1.5CT Transformer T1 is required, ensuring enough headroom for the ADP3330 LDO to output a regulated 5 V output.

### **OUTLINE DIMENSIONS**

COMPLIANT TO JEDEC STANDARDS MS-013-AA
CONTROLLING DIMENSIONS ARE IN MILLIMETERS; INCH DIMENSIONS
(IN PARENTHESES) ARE ROUNDED-OFF MILLIMETER EQUIVALENTS FOR
REFERENCE ONLY AND ARE NOT APPROPRIATE FOR USE IN DESIGN.

Figure 35. 16-Lead Standard Small Outline Package [SOIC\_W] Wide Body (RW-16) Dimensions shown in millimeters and (inches)

#### **ORDERING GUIDE**

| Model                          | Data Rate (Mbps) | Temperature Range | Package Description | Package Option |
|--------------------------------|------------------|-------------------|---------------------|----------------|
| ADM2485BRWZ <sup>1</sup>       | 16               | -40°C to +85°C    | 16-Lead SOIC_W      | RW-16          |
| ADM2485BRWZ-REEL7 <sup>1</sup> | 16               | –40°C to +85°€    | 16-Lead SOIC_W -    | RW-16          |
