## Dual LDO with Low Noise, Low I_Q and High PSRR

ISL9011A is a high performance dual LDO capable of sourcing 150mA current from Channel 1 and 300mA from Channel 2. The device has a low standby current and high-PSRR and is stable with output capacitance of 1µF to 10µF with ESR of up to 200mΩ.

A reference bypass pin allows an external capacitor for adjusting a noise filter for low noise and high PSRR applications.

The quiescent current is typically only 45µA with both LDOs enabled and active. Separate enable pins control each individual LDO output. When both enable pins are low, the device is in shutdown, typically drawing less than 0.1µA.

Several combinations of voltage outputs are standard. Output voltage options for each LDO range from 1.5V to 3.3V. Other output voltage options may be available upon request.

TOP VIEW

Pin		Pin
VIN	1	10 VO1
EN1	2	9 VO2
EN2	3	8 NC
CBYP	4	7 NC
NC	5	6 GND

Features

- Integrates two high performance LDOs
  - VO1 - 150mA output
  - VO2 - 300mA output

- Excellent transient response to large current steps

- Excellent load regulation: <1% voltage change across full range of load current

- High PSRR: 70dB @ 1kHz

- Wide input voltage capability: 2.3V to 6.5V

- Extremely low quiescent current: 45µA (both LDOs active)

- Low dropout voltage: typically 120mV @ 150mA

- Low output noise: typically 30µV$_{RMS}$ @ 100µA (1.5V)

- Stable with 1µF to 10µF ceramic capacitors

- Separate enable pins for each LDO

- Soft-start to limit input current surge during enable

- Current limit and overheat protection

- ±1.8% accuracy over all operating conditions

- Tiny 10 Ld 3mm x 3mm DFN package

- -40°C to +85°C operating temperature range

- Pin compatible with Micrel MIC2211

- Pb-free (RoHS compliant)

Applications

- PDAs, Cell Phones and Smart Phones

- Portable Instruments, MP3 Players

- Handheld Devices including Medical Handhelds

NOTES:

1. Add "-T" suffix for tape and reel. Please refer to TB347 for details on reel specifications.

2. For availability and lead time of devices with voltage combinations not listed in the table, contact Intersil Marketing.

3. These Intersil Pb-free plastic packaged products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate PLUS ANNEAL - e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

Absolute Maximum Ratings

Supply Voltage (VIN) . . . . +7.1V
V_O1, V_O2 Pins . . . . +3.6V
All Other Pins . . . . -0.3 to $(V_{IN} + 0.3)$V

Recommended Operating Conditions

Ambient Temperature Range (T_A) . . . . -40°C to +85°C
Supply Voltage (VIN) . . . . 2.3V to 6.5V

Thermal Information

Thermal Resistance (Notes 4, 5) θ_{JA} (°C/W) θ_{JC} (°C/W)
  10 Ld 3x3 DFN Package 50   10
Junction Temperature Range . . . .-40°C to +125°C
Operating Temperature Range . . . .-40°C to +85°C
Storage Temperature Range . . . .-65°C to +150°C
Pb-free reflow profile . . . . .see link below
  http://www.intersil.com/pbfree/Pb-FreeReflow.asp

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

4. θ_{JA} is measured in free air with the component mounted on a high effective thermal conductivity test board with "direct attach" features. See Tech Brief TB379.

5. For θ_{JC}, the "case temp" location is the center of the exposed metal pad on the package underside.

Electrical Specifications

Unless otherwise noted, all parameters are guaranteed over the operational supply voltage and temperature range of the device as follows: T_A = -40°C to +85°C; V_{IN} = (V_O + 1.0V) to 6.5V with a minimum V_{IN} of 2.3V; C_{IN} = 1µF; C_O = 1µF; C_{BYP} = 0.01µF

Pin Descriptions

PIN NUMBER	PIN NAME	TYPE	DESCRIPTION
1	VIN	Analog I/O	Supply Voltage/LDO Input: Connect a 1µF capacitor to GND.
2	EN1	Low Voltage Compatible CMOS Input	LDO-1 Enable.
3	EN2	Low Voltage Compatible CMOS Input	LDO-2 Enable.
4	CBYP	Analog I/O	Reference Bypass Capacitor Pin: Optionally connect capacitor of value 0.01µF to 1µF between this pin and GND to tune in the desired noise and PSRR performance.
5, 7, 8	NC	NC	No Connection
6	GND	Ground	GND is the connection to system ground. Connect to PCB Ground plane.
9	VO2	Analog I/O	LDO-2 Output: Connect capacitor of value 1µF to 10µF to GND (1µF recommended).
10	VO1	Analog I/O	LDO-1 Output: Connect capacitor of value 1µF to 10µF to GND (1µF recommended).

## Typical Application
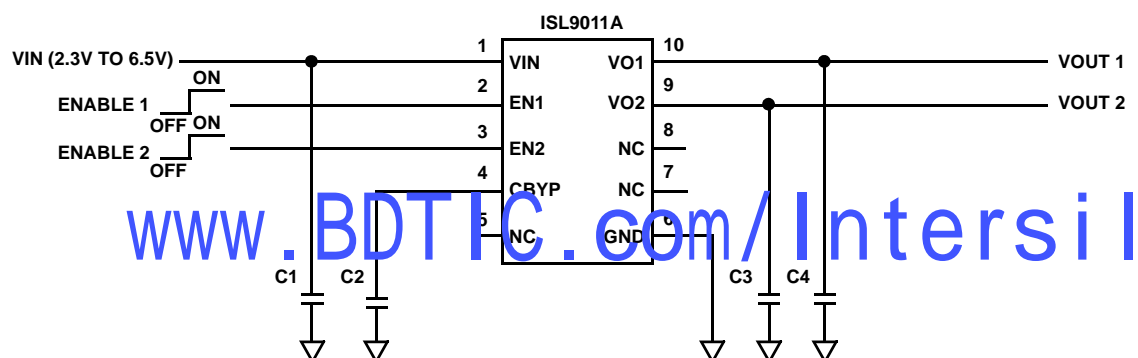

C1, C3, C4: 1µF X5R CERAMIC CAPACITOR
C2: 0.1µF X5R CERAMIC CAPACITOR

Block Diagram

Functional Description

The ISL9011A contains all circuitry required to implement two high performance LDOs. High performance is achieved through a circuit that delivers fast transient response to varying load conditions. In a quiescent condition, the ISL9011A adjusts its biasing to achieve the lowest standby current consumption.

The device also integrates current limit protection, smart thermal shutdown protection, staged turn-on and soft-start. Smart Thermal shutdown protects the device against overheating. Staged turn-on and soft-start minimize start-up input current surges without causing excessive device turn-on time.

Power Control

The ISL9011A has two separate enable pins (EN1 and EN2) to individually control power to each of the LDO outputs. When both EN1 and EN2 are low, the device is in shutdown

mode. During this condition, all on-chip circuits are off, and the device draws minimum current, typically less than 0.1µA. When one or both of the enable pins are asserted, the device first polls the output of the UVLO detector to ensure that VIN voltage is at least about 2.1V. Once verified, the device initiates a start-up sequence. During the start-up sequence, trim settings are first read and latched. Then, sequentially, the bandgap, reference voltage and current generation circuitry power-up. Once the references are stable, a fast-start circuit quickly charges the external reference bypass capacitor (connected to the CBYP pin) to the proper operating voltage. After the bypass capacitor has been charged, the LDO's power-up.

If EN1 is brought high, and EN2 goes high before the VO1 output stabilizes, the ISL9011A delays the VO2 turn-on until the VO1 output reaches its target level.

If EN2 is brought high, and EN1 goes high before VO2 starts its output ramp, then VO1 turns on first and the ISL9011A

intersil

delays the VO2 turn-on until the VO1 output reaches its target level.

If EN2 is brought high, and EN1 goes high after VO2 starts its output ramp, then the ISL9011A immediately starts to ramp up the VO1 output.

If both EN1 and EN2 are brought high at the same time, the VO1 output has priority, and is always powered up first.

During operation, whenever the VIN voltage drops below about 1.8V, the ISL9011A immediately disables both LDO outputs. When VIN rises back above 2.1V, the device re-initiates its start-up sequence and LDO operation will resume automatically.

Reference Generation

The reference generation circuitry includes a trimmed bandgap, a trimmed voltage reference divider, a trimmed current reference generator, and an RC noise filter. The filter includes the external capacitor connected to the CBYP pin. A 0.01µF capacitor connected CBYP implements a 100Hz lowpass filter, and is recommended for most high performance applications. For the lowest noise application, a 0.1µF or greater CBYP capacitor should be used. This filters the reference noise to below the 10Hz to 1kHz frequency band, which is crucial in many noise-sensitive applications.

The bandgap generates a zero temperature coefficient (TC) voltage for the reference divider. The reference divider provides the regulator reference and other voltage references required for current generation and over-temperature detection.

The current generator outputs references required for adaptive biasing as well as references for LDO output current limit and thermal shutdown determination.

LDO Regulation and Programmable Output Divider

The LDO Regulator is implemented with a high-gain operational amplifier driving a PMOS pass transistor. The design of the ISL9011A provides a regulator that has low quiescent current, fast transient response, and overall stability across all operating and load current conditions. LDO stability is guaranteed for a 1µF to 10µF output capacitor that has a tolerance better than 20% and ESR less than 200mΩ. The design is performance-optimized for a 1µF capacitor. Unless limited by the application, use of an output capacitor value above 4.7µF is not recommended as LDO performance improvement is minimal.

Soft-start circuitry integrated into each LDO limits the initial ramp-up rate to about 30µs/V to minimize current surge. The ISL9011A provides short-circuit protection by limiting the output current to about 475mA.

Each LDO uses an independently trimmed 1V reference. An internal resistor divider drops the LDO output voltage down to 1V. This is compared to the 1V reference for regulation. The resistor division ratio is programmed in the factory.

Overheat Detection

The bandgap outputs a proportional-to-temperature current that is indicative of the temperature of the silicon. This current is compared with references to determine if the device is in danger of damage due to overheating. When the die temperature reaches about +145°C, one or both of the LDO's momentarily shut down until the die cools sufficiently. In the overheat condition, only the LDO sourcing more than 50mA will be shut off. This does not affect the operation of the other LDO. If both LDOs source more than 50mA and an overheat condition occurs, both LDO outputs are disabled. Once the die temperature falls back below about +110°C, the disabled LDO(s) are re-enabled and soft-start automatically takes place.
