

## Low Noise/Low Power/I<sup>2</sup>C Bus/256 Taps

The ISL90810 integrates a digitally controlled potentiometer (XDCP) on a monolithic CMOS integrated circuit.

The digitally controlled potentiometers are implemented with a combination of resistor elements and CMOS switches. The position of the wipers are controlled by the user through the I<sup>2</sup>C bus interface. Each potentiometer has an associated Wiper Register (WR) that can be directly written to and read by the user. The contents of the WR controls the position of the wiper. When powered on the ISL90810's wiper will always commence at mid-scale (128 tap position).

The DCP can be used as three-terminal potentiometer or as two-terminal variable resistor in a wide variety of applications including control, parameter adjustments, and signal processing.

## Features

- 256 resistor taps - 0.4% resolution
- I<sup>2</sup>C serial interface with write/read capability
- Power-on preset to mid-scale (128 tap position)
- Wiper resistance: 70Ω typical @ 3.3V
- Standby current 5μA max
- Power supply: 2.7V to 5.5V
- 50kΩ, 10kΩ total resistance
- 8 Ld MSOP
- Pb-free plus anneal available (RoHS compliant)

\*Add "-TK" suffix for tape and reel.

NOTE: Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

**SDA vs SCL Timing****NOTES:**

- Typical values are for  $T_A = +25^\circ\text{C}$  and 3.3V supply voltage.
- LSB:  $[V(RW)_{255} - V(RW)_0]/255$ .  $V(RW)_{255}$  and  $V(RW)_0$  are  $V(RW)$  for the DCP register set to FF hex and 00 hex respectively. LSB is the incremental voltage when changing from one tap to an adjacent tap.
- ZS error =  $V(RW)_0/\text{LSB}$ .
- FS error =  $[V(RW)_{255} - V_{CC}]/\text{LSB}$ .
- $\text{DNL} = [V(RW)_i - V(RW)_{i-1}]/\text{LSB} - 1$ , for  $i = 1$  to 255.  $i$  is the DCP register setting.
- $\text{INL} = (V(RW)_i - i \cdot \text{LSB} - V(RW)_0)/\text{LSB}$ , for  $i = 1$  to 255.
- $\text{TC}_V = \frac{\text{Max}(V(RW)_i) - \text{Min}(V(RW)_i)}{[\text{Max}(V(RW)_i) + \text{Min}(V(RW)_i)]/2} \times \frac{10^6}{145^\circ\text{C}}$  for  $i = 16$  to 240 decimal,  $T = -40^\circ\text{C}$  to  $+105^\circ\text{C}$ .  $\text{Max}()$  is the maximum value of the wiper voltage and  $\text{Min}()$  is the minimum value of the wiper voltage over the temperature range.
- $\text{MI} = |R_{255} - R_0|/255$ .  $R_{255}$  and  $R_0$  are the measured resistances for the DCP register set to FF hex and 00 hex respectively.  $\text{Roffset} = R_0/\text{MI}$ , when measuring between RW and RL.
- $\text{Roffset} = R_{255}/\text{MI}$ , when measuring between RW and RH.
- $\text{RDNL} = (R_i - R_{i-1})/\text{MI}$ , for  $i = 32$  to 255.
- $\text{RINL} = [R_i - (\text{MI} \cdot i) - R_0]/\text{MI}$ , for  $i = 32$  to 255.
- $\text{TC}_R = \frac{[\text{Max}(R_i) - \text{Min}(R_i)]}{[\text{Max}(R_i) + \text{Min}(R_i)]/2} \times \frac{10^6}{145^\circ\text{C}}$  for  $i = 32$  to 255,  $T = -40^\circ\text{C}$  to  $+105^\circ\text{C}$ .  $\text{Max}()$  is the maximum value of the resistance and  $\text{Min}()$  is the minimum value of the resistance over the temperature range.
- This parameter is not 100% tested.

## Principles of Operation

The ISL90810 is an integrated circuit incorporating one DCP with its associated registers, and an I<sup>2</sup>C serial interface providing direct communication between a host and the potentiometer.

### DCP Description

The DCP is implemented with a combination of resistor elements and CMOS switches. The physical ends of the DCP are equivalent to the fixed terminals of a mechanical potentiometer (RL and RH pins). The RW pin of the DCP is connected to intermediate nodes, and is equivalent to the wiper terminal of a mechanical potentiometer. The position of the wiper terminal within the DCP is controlled by an 8-bit volatile Wiper Register (WR). When the WR of the DCP contains all zeroes (WR[7:0]: 00h), its wiper terminal (RW) is closest to its “Low” terminal (RL). When the WR of the DCP contains all ones (WR[7:0]: FFh), its wiper terminal (RW) is closest to its “High” terminal (RH). As the value of the WR increases from all zeroes (0 decimal) to all ones (255 decimal), the wiper moves monotonically from the position closest to RL to the closest to RH. At the same time, the resistance between RW and RL increases monotonically, while the resistance between RH and RW decreases monotonically.

While the ISL90810 is being powered up, The WR is reset to 80h (128 decimal), which locates RW roughly at the center between RL and RH.

The WR can be read or written to directly using the I<sup>2</sup>C serial interface as described in the following sections. The I<sup>2</sup>C interface Address Byte has to be set to 00hex to access the WR.

## I<sup>2</sup>C Serial Interface

The ISL90810 supports a bidirectional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is a master and the device being controlled is the slave. The master always initiates data transfers and provides the clock for both transmit and receive operations. Therefore, the ISL90810 operates as a slave device in all applications.

All communication over the I<sup>2</sup>C interface is conducted by sending the MSB of each byte of data first.

### Protocol Conventions

Data states on the SDA line must change only during SCL LOW periods. SDA state changes during SCL HIGH are reserved for indicating START and STOP conditions (See Figure 15). On power-up of the ISL90810 the SDA pin is in the input mode.

All I<sup>2</sup>C interface operations must begin with a START condition, which is a HIGH to LOW transition of SDA while SCL is HIGH. The ISL90810 continuously monitors the SDA and SCL lines for the START condition and does not respond to any command until this condition is met (See Figure 15). A START condition is ignored during the power-up for the device.

All I<sup>2</sup>C interface operations must be terminated by a STOP condition, which is a LOW to HIGH transition of SDA while SCL is HIGH (See Figure 15). A STOP condition at the end of a read operation, or at the end of a write operation places the device in its standby mode.

An acknowledge (ACK) is a software convention used to indicate a successful data transfer. The transmitting device, either master or slave, releases the SDA bus after transmitting eight bits. During the ninth clock cycle, the receiver pulls the SDA line LOW to acknowledge the reception of the eight bits of data (See Figure 16).

The ISL90810 responds with an ACK after recognition of a START condition followed by a valid Identification Byte, and once again after successful receipt of an Address Byte. The ISL90810 also responds with an ACK after receiving a Data Byte of a write operation. The master must respond with an ACK after receiving a Data Byte of a read operation.

A valid Identification Byte contains 0101000 as the seven MSBs. The LSB is the Read/Write bit. Its value is "1" for a Read operation, and "0" for a Write operation (See Table 1)

The address byte is set to 00h and follows the identification byte. Read and write operations always point to address 00h, indicating the WR for the device.

TABLE 1. IDENTIFICATION BYTE FORMAT

0	1	0	1	0	0	0	R/W
(MSB)							(LSB)

### Write Operation

A Write operation requires a START condition, followed by a valid Identification Byte, a valid Address Byte, a Data Byte, and a STOP condition. After each of the three bytes, the ISL90810 responds with an ACK. At this time the device enters its standby state (See Figure 17).

### Data Protection

A valid Identification Byte, Address Byte, and total number of SCL pulses act as a protection for the registers. During a Write sequence, the Data Byte is loaded into an internal shift register as it is received. The Data Byte is transferred to the Wiper Register (WR) at the falling edge of the SCL pulse that loads the last bit (LSB) of the Data Byte.

### Read Operation

A Read operation consists of a three byte instruction followed by one Data Byte (See Figure 18). The master initiates the operation issuing the following sequence: a START, the identification byte with the R/W bit set to "0", an Address Byte, a second START, and a second Identification byte with the R/W bit set to "1". After each of the three bytes, the ISL90810 responds with an ACK. The the ISL90810 transmits Data Bytes as long as the master responds with an ACK during the SCL cycle following the eighth bit of each byte. The master terminates the read operation (issuing a ACK and a STOP condition) following the last bit of the Data Byte (See Figure 18).

#### NOTES:

- These package dimensions are within allowable dimensions of JEDEC MO-187AA.
- Dimensioning and tolerancing per ANSI Y14.5M-1994.
- Dimension "D" does not include mold flash, protrusions or gate burrs and are measured at Datum Plane. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
- Dimension "E1" does not include interlead flash or protrusions and are measured at Datum Plane.  $\square$ -H- Interlead flash and protrusions shall not exceed 0.15mm (0.006 inch) per side.
- Formed leads shall be planar with respect to one another within 0.10mm (0.004) at seating Plane.
- "L" is the length of terminal for soldering to a substrate.
- "N" is the number of terminal positions.
- Terminal numbers are shown for reference only.
- Dimension "b" does not include dambar protrusion. Allowable dambar protrusion shall be 0.08mm (0.003 inch) total in excess of "b" dimension at maximum material condition. Minimum space between protrusion and adjacent lead is 0.07mm (0.0027 inch).
- Datums  $\square$ -A- and  $\square$ -B- to be determined at Datum plane  $\square$ -H-.
- Controlling dimension: MILLIMETER. Converted inch dimensions are for reference only.

All Intersil U.S. products are manufactured, assembled and tested utilizing ISO9000 quality systems.

Intersil Corporation's quality certifications can be viewed at [www.intersil.com/design/quality](http://www.intersil.com/design/quality)
