## USB1T1103

### Universal Serial Bus Peripheral Transceiver with Voltage Regulator

#### General Description

This chip provides a USB Transceiver functionality with a voltage regulator that is compliant to USB Specification Rev 2.0. this integrated 5V to 3.3V regulator allows interfacing of USB Application specific devices with supply voltages ranging from 1.65V to 3.6V with the physical layer of Universal Serial Bus. It is capable of operating at 12Mbps/s (full speed) data rates and hence is fully compliant to USB Specification Rev 2.0. The Vbusmon terminal allows for monitoring the Vbus line.

The USB1T1103 also provides exceptional ESD protection with 15kV contact HBM on D+, D- terminals.

#### Features

- Complies with Universal Serial Bus Specification 2.0
- Integrated 5V to 3.3V voltage regulator for powering VBus
- Utilizes digital inputs and outputs to transmit and receive USB cable data
- Supports full speed (12Mbps/s) data rates
- Ideal for portable electronic devices
- MLP technology package (16 terminal) with HBCC footprint
- 15kV contact HBM ESD protection on bus terminals
- Supports disable mode and is functionally equivalent to Philips ISP1102

#### Applications

- PDA
- PC Peripherals
- Cellular Phones
- MP3 Players
- Digital Still Camera
- Information Appliance

#### Ordering Code:

Order Number	Package Number	Package Description
USB1T1103MPX	MLP14D	Pb-Free 14-Terminal Molded Leadless Package (MLP), 2.5mm Square
USB1T1103MHX	MLP16HB	Pb-Free 16-Terminal Molded Leadless Package (MHBCC), JEDEC MO-217, 3mm Square

Pb-Free package per JEDEC J-STD-020B.

## Terminal Descriptions

Terminal Number		Terminal Name	I/O	Terminal Description
MLP14	MLP16			
1	1	$\overline{OE}$	I	Output Enable: Active LOW enables the transceiver to transmit data on the bus. When not active the transceiver is in the receive mode (CMOS level is relative to $V_{CCIO}$ ).
2	2	RCV	O	Receive Data Output: Non-inverted CMOS level output for USB differential Input (CMOS output level is relative to $V_{CCIO}$ ). Driven LOW when SUSPN is HIGH; RCV output is stable and preserved during SE0 condition.
3	3	$V_p/V_{po}$	I/O	Single-ended D+ receiver output $V_p$ (CMOS level relative to $V_{CCIO}$ ): Used for external detection of SE0, error conditions, speed of connected device; Terminal also acts as drive data input $V_{po}$ (see Table 1 and Table 2). Output drive is 4 mA buffer.
4	4	$V_m/V_{mo}$	I/O	Single-ended D- receiver output $V_m$ (CMOS level relative to $V_{CCIO}$ ): Used for external detection of SE0, error conditions, speed of connected device; Terminal also acts as drive data input $V_{mo}$ (see Table 1 and Table 2). Output drive is 4 mA buffer.
5	5	SUSPND	I	Suspend: Enables a low power state (CMOS level is relative to $V_{CCIO}$ ). While the SUSPND terminal is active (HIGH) it will drive the RCV terminal to logic "0" state.
—	6	NC		No Connect
6	7	$V_{CCIO}$		Supply Voltage for digital I/O terminals (1.65V to 3.6V): When not connected the D+ and D- terminals are in 3-STATE. This supply bus is totally independent of $V_{CC}$ (5V) and $V_{REG}$ (3.3V), and must never exceed the $V_{REG}$ (3.3) voltage. For $V_{CCIO}$ disconnected the O+/O- terminals are HIGH Impedance and the $V_{PU}$ (3.3V) is turned off.
7	8	Vbusmon	O	Vbus monitor output (CMOS level relative to $V_{CCIO}$ ): When $V_{bus} > 4.1V$ then Vbusmon = HIGH and when $V_{bus} < 3.6V$ then Vbusmon = LOW. If SUSPND = HIGH then Vbusmon is pulled HIGH.
9, 8	10, 9	D+, D-	AI/O	Data +, Data -: Differential data bus conforming to the USB standard. Terminals are HIGH Impedance for bus powered mode when $V_{bus} < 3.6V$ . For ByPass Mode then HIGH Impedance when $V_{REG}/V_{bus} < V_{REG}$ minimum.
10	11	NC		No Connect
—	12	NC		No Connect
11	13	$V_{REG}$ (3.3V)		Internal Regulator Option: Regulated supply output voltage (3.0V to 3.6V) during 5V operation; decoupling capacitor of at least 0.1 $\mu F$ is required. Regulator ByPass Option: Used as supply voltage input for 3.3V operation.
12	14	$V_{CC}$ (5.0V)		Internal Regulator Option: Used as supply voltage input (4.0V to 5.5V); can be connected directly to USB line Vbus. Regulator ByPass Option: Connected to $V_{REG}$ (3.3V)
13	15	$V_{PU}$ (3.3V)		Pull-up Supply Voltage ( $3.3V \pm 10\%$ ): Connect an external 1.5k $\Omega$ resistor on D+ (FS data rate); Terminal function is controlled by Config input terminal: Config = LOW – $V_{PU}$ (3.3V) is floating (HIGH Impedance) for zero pull-up current. Config = HIGH – $V_{PU}$ (3.3V) = 3.3V; internally connected to $V_{REG}$ (3.3V). $V_{PU}$ is OFF in disable mode.
14	16	Config	I	USB connect or disconnect software control input. Configures 3.3V to external 1.5k $\Omega$ resistor on D+ when HIGH.
Exposed Diepad	Exposed Diepad	GND	GND	GND supply down bonded to exposed diepad to be connected to the PCB GND.

## Functional Description

The USB1T1103 transceiver is designed to convert CMOS data into USB differential bus signal levels and to convert USB differential bus signal to CMOS data.

To minimize EMI and noise the outputs are edge rate controlled with the rise and fall times controlled and defined for full speed data rates only (12Mbits/s). The rise, fall times are balanced between the differential terminals to minimize skew.

The USB1T1103 differs from earlier USB Transceiver in that the  $V_p/V_m$  and  $V_{po}/V_{mo}$  terminals are now I/O terminals

rather than discrete input and output terminals. Table 1 describes the specific terminal functionality selection. Table 2 and Table 3 describe the specific Truth Tables for Driver and Receiver operating functions.

The USB1T1103 also has the capability of various power supply configurations, including a disable mode for  $V_{CCIO}$  disconnected, to support mixed voltage supply applications (see Table 4) and Section 2.1 for detailed descriptions.

## Functional Tables

TABLE 1. Function Select

SUSPND	$\overline{OE}$	D+, D-	RCV	$V_p/V_{po}$	$V_m/V_{mo}$	Function
L	L	Driving & Receiving	Active	$V_{po}$ Input	$V_{mo}$ Input	Normal Driving (Differential Receiver Active)
L	H	Receiving (Note 1)	Active	$V_p$ Output	$V_m$ Output	Receiving
H	L	Driving	Inactive (Note 2)	$V_{po}$ Input	$V_{mo}$ Input	Driving during Suspend (Differential Receiver Inactive)
H	H	3-STATE (Note 1)	Inactive (Note 2)	$V_p$ Output	$V_m$ Output	Low Power State

**Note 1:** Signal levels is function of connection and/or pull-up/pull-down resistors.

**Note 2:** For SUSPND = HIGH mode the differential receiver is inactive and the output RCV is forced LOW. The out-of-suspend signaling (K) is detected by the single-ended receivers of the  $V_p/V_{po}$  and  $V_m/V_{mo}$  terminals.

TABLE 2. Driver Function ( $\overline{OE} = L$ ) using Differential Input Interface

$V_m/V_{mo}$	$V_p/V_{po}$	Data (D+ / D-)
L	L	SE0 (Note 3)
L	H	Differential Logic 1
H	L	Differential Logic 0
H	H	Illegal State

**Note 3:** SE0 = Single Ended Zero

TABLE 3. Receiver Function ( $\overline{OE} = H$ )

D+, D-	RCV	$V_p/V_{po}$	$V_m/V_{mo}$
Differential Logic 1	H	H	L
Differential Logic 0	L	L	H
SE0	X	L	L

X = Don't Care

RCV(0) denotes the signal level on output RCV just prior to the SE0 or SE1 event. This level is stable during the SE0 or SE1 event period.

## Power Supply Configurations and Options

The three modes of power supply operation are:

- Normal Mode: Regulated Output and Regulator Bypass
  1. Regulated Output:  $V_{CCIO}$  is connected and  $V_{CC}(5.0)$  is connected to 5V (4.0V to 5.5V) and the internal voltage regulator then produces 3.3V for the USB connections.
  2. Internal Regulator Bypass Mode:  $V_{CCIO}$  is connected and both  $V_{CC}(5.0)$  and  $V_{REG}(3.3)$  are connected to a 3.3V source (3.0V to 3.6V).

In both cases for normal mode the  $V_{CCIO}$  is an independent voltage source (1.65V to 3.6V) that is a function of the external circuit configuration.

- Sharing Mode:  $V_{CCIO}$  is only supply connected.  $V_{CC}$  and  $V_{REG}$  are not connected. In this mode the D+ and D- terminals are 3-STATE and the USB1T1103 allows external

signals up to 3.6V to share the D+ and D- bus lines. Internally the circuitry limits leakage from D+ and D- terminals (maximum 10  $\mu$ A) and  $V_{CCIO}$  such that device is in low power (suspended) state. Terminals Vbusmon and RCV are forced LOW as an indication of this mode with Vbusmon being ignored during this state.

- Disable Mode:  $V_{CCIO}$  is not connected.  $V_{CC}$  is connected, or  $V_{CC}$  and  $V_{REG}$  are connected. 0V to 3.3V in this mode D+ and D- are 3-STATE and  $V_{PU}$  is HIGH Impedance (switch is turned off). The USB1T1103 allows external signals up to 3.6V to share the D+ and D- bus lines. Internally the circuitry limits leakage from D+ and D- pins (maximum 10 $\mu$ A).

A summary of the Supply Configurations is described in Table 4.

TABLE 4. Power Supply Configuration Options

Terminals	Power Supply Mode Configuration			
	Disable	Sharing	Normal (Regulated Output)	Normal (Regulator Bypass)
$V_{CC}$ (5V)	Connected to 5V source	Not Connected or <3.6V	Connected to 5V Source	Connected to $V_{REG}$ (3.3V) [Max Drop of 0.3V] (2.7V to 3.6V)
$V_{REG}$ (3.3V)	3.3V, 300 $\mu$ A Regulated Output	Not Connected	3.3V, 300 $\mu$ A Regulated Output	Connected to 3.3V Source
$V_{CCIO}$	$\leq 0.5V$	1.65V to 3.6V Source	1.65V to 3.6V Source	1.65V to 3.6V Source
$V_{PU}$ (3.3V)	3-STATE (off)	3-STATE (Off)	3.3V Available if Config = HIGH	3.3V Available if Config = HIGH
D+, D-	3-STATE (off)	3-STATE	Function of Mode Set Up	Function of Mode Set Up
$V_P/V_{PO}$ , $V_M/V_{MO}$	Invalid [I]	L	Function of Mode Set Up	Function of Mode Set Up
RCV	Invalid [I]	L	Function of Mode Set Up	Function of Mode Set Up
Vbusmon	Invalid [I]	L	Function of Mode Set Up	Function of Mode Set Up
OE, SUSPND, Config	Hi-Z	Hi-Z	Function of Mode Set Up	Function of Mode Set Up

Invalid [I] I/O are to be 3-STATE, outputs to be LOW.

## ESD Protection

### ESD Performance of the USB1T1103

HBM D+/D-: 15.0kV

HBM, all other terminals (Mil-Std 883E): 6.5kV

### ESD Protection: D+/D- Terminals

Since the differential terminals of a USB transceiver may be subjected to extreme ESD voltages, additional immunity has been included in the D+ and D- terminals without compromising performance. The USB1T1103 differential terminals have ESD protection to the following limits:

- 15kV using the contact Human Body Model
- 8kV using the Contact Discharge method as specified in IEC 61000-4-2

### Human Body Model

Figure 1 shows the schematic representation of the Human Body Model ESD event. Figure 2 is the ideal waveform representation of the Human Body Model.

### IEC 61000-4-2, IEC 60749-26 and IEC 60749-27

The IEC 61000-4-2 standard covers ESD testing and performance of finished equipment, and as such evaluates the equipment in its entirety for ESD immunity. Fairchild Semiconductor has evaluated this device using the IEC 6100-4-2 representative system model depicted in Figure 3. Under the additional standards set forth by the IEC, this device is also compliant with IEC 60749-26 (HBM) and IEC 60749-27 (MM).

### Additional ESD Test Conditions

For additional information regarding our product test methodologies and performance levels, please contact Fairchild Semiconductor.

**Absolute Maximum Ratings**(Note )

Supply Voltage ( $V_{CC}$ )(5V)	-0.5V to +6.0V
I/O Supply Voltage ( $V_{CCIO}$ )	-0.5V to +4.6V
Latch-up Current ( $I_{LU}$ )	
$V_I = -1.8V$ to $+5.4V$	150 mA
DC Input Current ( $I_{IK}$ )	
$V_I < 0$	-18 mA
DC Input Voltage ( $V_I$ )	
(Note )	-0.5V to $V_{CCIO} + 0.5V$
DC Output Diode Current ( $I_{OK}$ )	
$V_O > V_{CC}$ or $V_O < 0$	$\pm 18$ mA
DC Output Voltage ( $V_O$ )	
(Note )	-0.5V to $V_{CCIO} + 0.5V$
Output Source or Sink Current ( $I_O$ )	
$V_O = 0$ to $V_{CC}$	
Current for D+, D- Terminals	$\pm 12$ mA
Current for RCV, $V_m/V_p$	$\pm 12$ mA
DC $V_{CC}$ or GND Current	
( $I_{CC}$ , $I_{GND}$ )	$\pm 100$ mA
ESD Immunity Voltage ( $V_{ESD}$ );	
Contact HBM [3]	
Terminals D+, D-, $I_{LI} < 1\mu A$	$\pm 15kV$
All Other Terminals [3] $I_{LI} < 1\mu A$	$\pm 6.5kV$
Storage Temperature ( $T_{STO}$ )	-40°C to + 125°C
Power Dissipation ( $P_{TOT}$ )	
$I_{CC}$ (5V)	48 mW
$I_{CCIO}$	9 mW

**Recommended Operating Conditions**

DC Supply Voltage $V_{CC}$ (5V)	4.0V to 5.5V
I/O DC Voltage $V_{CCIO}$	1.65V to 3.6V
DC Input Voltage Range ( $V_I$ )	0V to $V_{CCIO} + 5.5V$
DC Input Range for AI/O ( $V_{AI/O}$ )	0V to $V_{CC}$
Terminals D+ and D-	0V to 3.6V
Operating Ambient Temperature	
( $T_{AMB}$ )	-40°C to +85°C

**Note 4:** The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristic tables are not guaranteed at the absolute maximum rating. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

**Note 5:** IO Absolute Maximum Rating must be observed.

**Note 6:** Per ESD Methodology described in page 5.

## LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
