<sup>10)</sup> is the voltage, where the device doesn't change its switching condition for 15ms after the supply voltage falling below the lower limit of  $V_{bb(\text{on})}$

<sup>11)</sup> not subject to production test, specified by design

<sup>12)</sup> Supply voltages higher than  $V_{bb(\text{AZ})}$  require an external current limit for the GND and status pins (a 150 $\Omega$  resistor for the GND connection is recommended). See also  $V_{ON(\text{CL})}$  in table of protection functions and circuit diagram on page 9.

<sup>13)</sup> Measured with load; for the whole device; all channels off

<sup>14)</sup> Add  $I_{ST}$ , if  $I_{ST} > 0$

<sup>15)</sup> Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

<sup>16)</sup> If channels are connected in parallel, output clamp is usually accomplished by the channel with the lowest  $V_{ON(\text{CL})}$

<sup>17)</sup> Requires a 150  $\Omega$  resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Power dissipation is higher compared to normal operating conditions due to the voltage drop across the drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 4 and circuit page 9).

<sup>18)</sup> If ground resistors  $R_{GND}$  are used, add the voltage drop across these resistors.

<sup>19)</sup> not subject to production test, specified by design

L = "Low" Level      X = don't care      Z = high impedance, potential depends on external circuit  
H = "High" Level      Status signal valid after the time delay shown in the timing diagrams

Parallel switching of channel 1 and 2 (also channel 3 and 4) is easily possible by connecting the inputs and outputs in parallel (see truth table). If switching channel 1 to 4 in parallel, the status outputs ST1/2 and ST3/4 have to be configured as a 'Wired OR' function with a single pull-up resistor.

## Terms

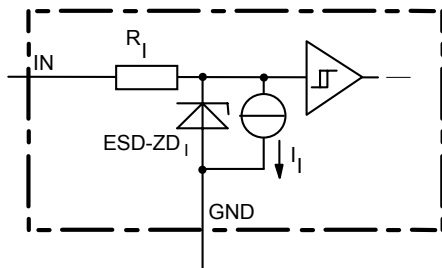

Leadframe ( $V_{bb}$ ) is connected to pin 1,10,11,12,15,16,19,20

External  $R_{GND}$  optional; two resistors  $R_{GND1}$ ,  $R_{GND2} = 150 \Omega$  or a single resistor  $R_{GND} = 75 \Omega$  for reverse battery protection up to the max. operating voltage.

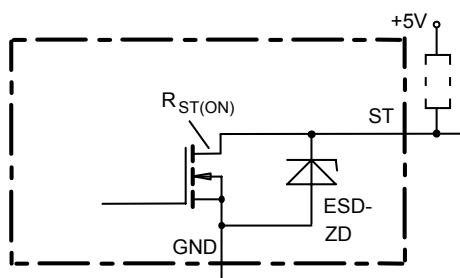

<sup>20)</sup> L, if potential at the Output exceeds the OpenLoad detection voltage

### Input circuit (ESD protection), IN1 to IN4

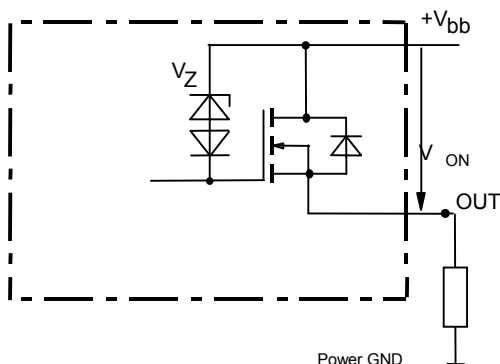

The use of ESD zener diodes as voltage clamp at DC conditions is not recommended.

### Status output, ST1/2 or ST3/4

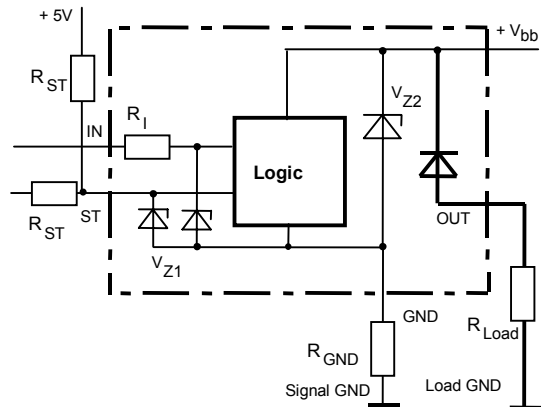

ESD-Zener diode: 6.1 V typ., max 0.3 mA;  $R_{ST(ON)} < 375 \Omega$  at 1.6 mA. The use of ESD zener diodes as voltage clamp at DC conditions is not recommended.

### Inductive and overvoltage output clamp, OUT1...4

$V_{ON}$  clamped to  $V_{ON(CL)} = 47 \text{ V typ.}$

### Overvolt. and reverse batt. protection

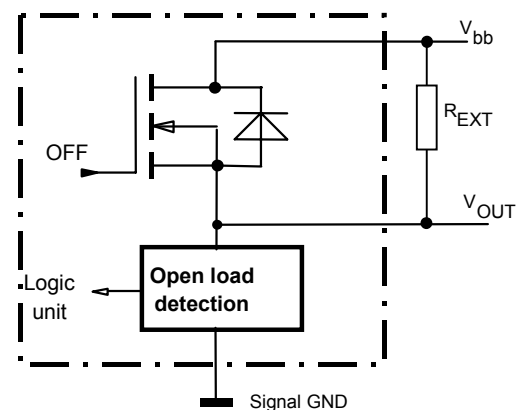

$V_{Z1} = 6.1 \text{ V typ.}$ ,  $V_{Z2} = 47 \text{ V typ.}$ ,  $R_{GND} = 150 \Omega$ ,  $R_{ST} = 15 \text{ k}\Omega$ ,  $R_I = 3.5 \text{ k}\Omega \text{ typ.}$

In case of reverse battery the load current has to be limited by the load. Temperature protection is not active

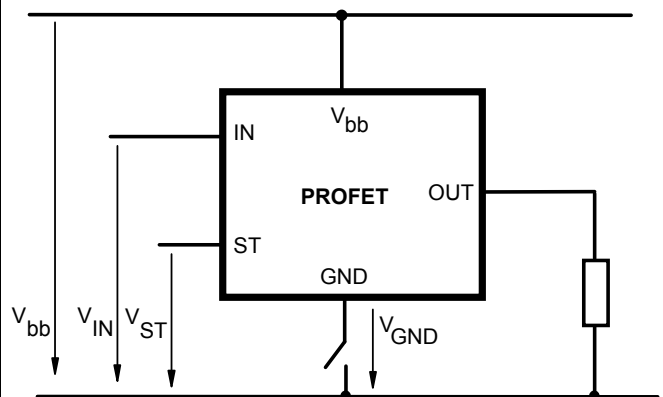

### Open-load detection, OUT1...4

OFF-state diagnostic condition:

Open Load, if  $V_{OUT} > 3 \text{ V typ.}$ ; IN low

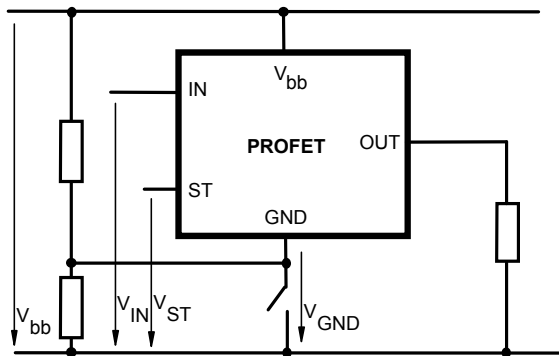

### GND disconnect

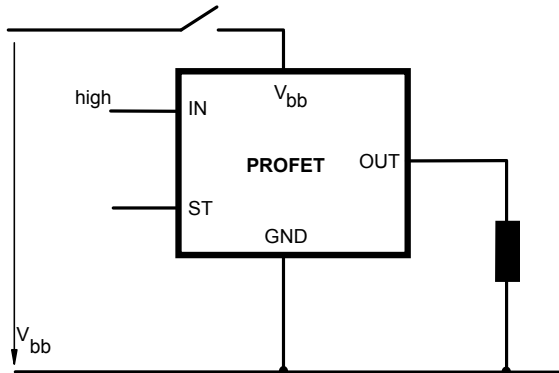

Any kind of load. In case of IN=high is  $V_{OUT} \approx V_{IN} - V_{IN(T+)}$ . Due to  $V_{GND} > 0$ , no  $V_{ST} = \text{low}$  signal available.

### GND disconnect with GND pull up

Any kind of load. If  $V_{GND} > V_{IN} - V_{IN(T+)}$  device stays off  
Due to  $V_{GND} > 0$ , no  $V_{ST}$  = low signal available.

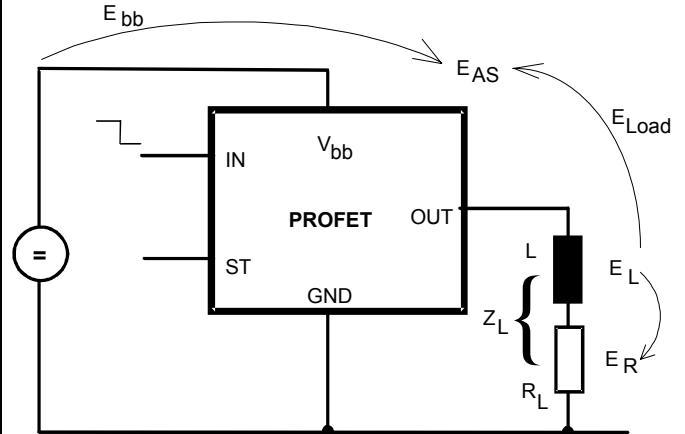

### V<sub>bb</sub> disconnect with energized inductive load

For inductive load currents up to the limits defined by  $Z_L$  (max. ratings and diagram on page 10) each switch is protected against loss of  $V_{bb}$ .

Consider at your PCB layout that in the case of  $V_{bb}$  disconnection with energized inductive load all the load current flows through the GND connection.

### Inductive load switch-off energy dissipation

Energy stored in load inductance:

$$E_L = \frac{1}{2} \cdot L \cdot I_L^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

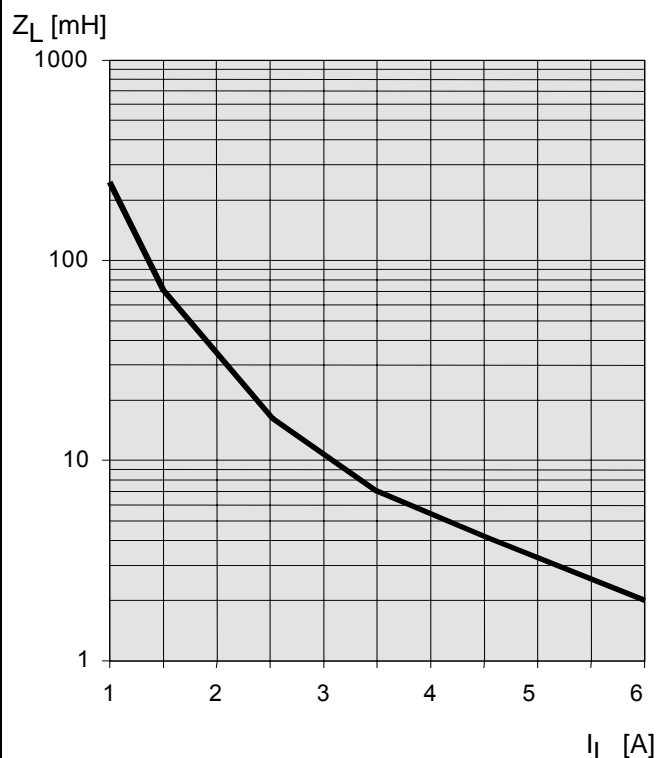

$$E_{AS} = E_{bb} + E_L - E_R = \int V_{ON(CL)} \cdot i_L(t) dt,$$

with an approximate solution for  $R_L > 0 \Omega$ :

$$E_{AS} = \frac{I_L \cdot L}{2 \cdot R_L} (V_{bb} + |V_{OUT(CL)}|) \ln \left( 1 + \frac{I_L \cdot R_L}{|V_{OUT(CL)}|} \right)$$

### Maximum allowable load inductance for a single switch off (one channel)<sup>4)</sup>

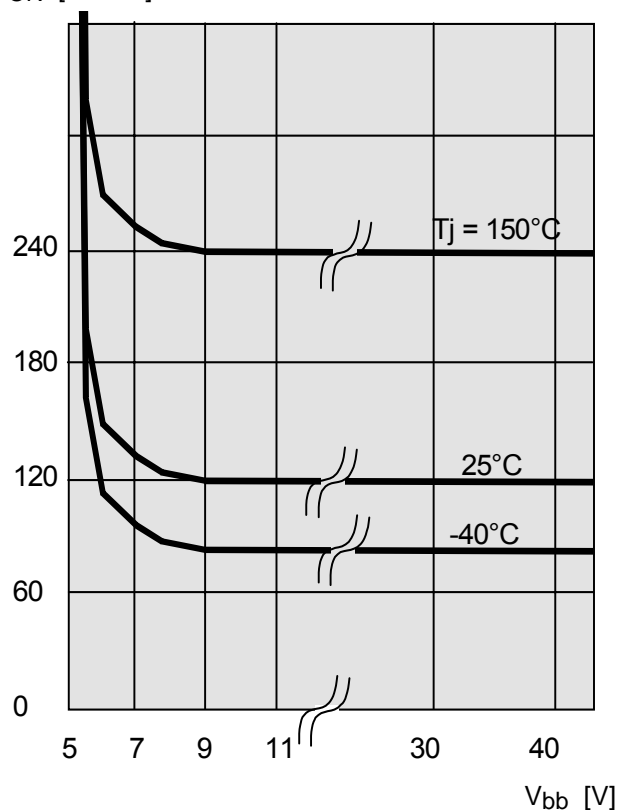

$L = f(I_L)$ ;  $T_{j,start} = 150^\circ\text{C}$ ,  $V_{bb} = 12\text{ V}$ ,  $R_L = 0 \Omega$

### Typ. on-state resistance

$R_{ON} = f(V_{bb}, T_j)$ ;  $I_L = 2\text{ A}$ ,  $I_N = \text{high}$

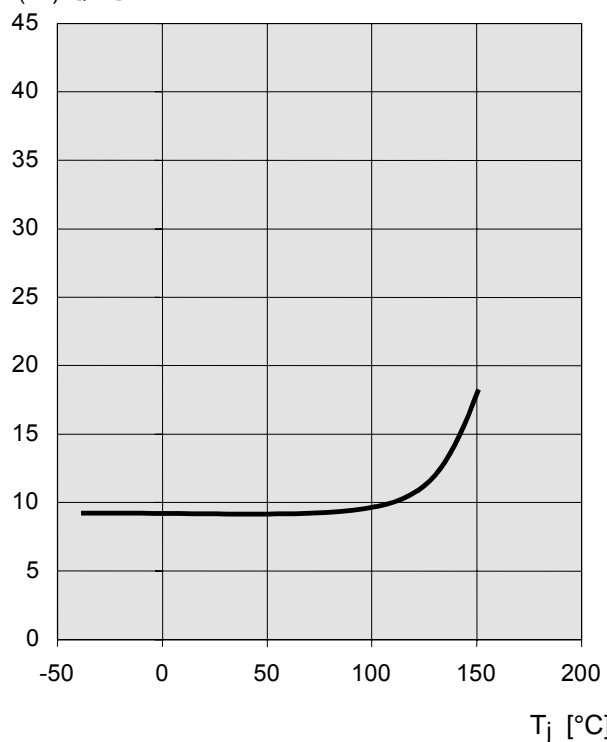

$R_{ON}$  [mOhm]

### Typ. standby current

$I_{bb(off)} = f(T_j)$ ;  $V_{bb} = 9 \dots 34\text{ V}$ ,  $I_{N1,2,3,4} = \text{low}$

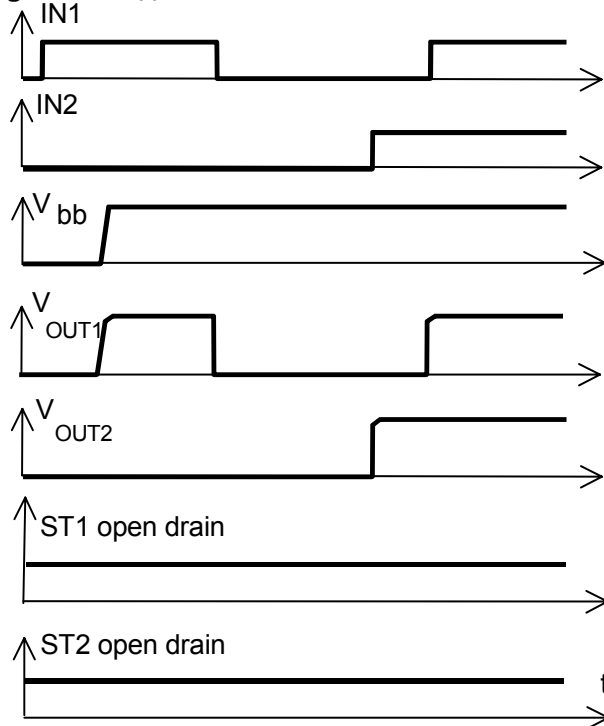

$I_{bb(off)}$  [ $\mu\text{A}$ ]
